# Buying a House: How Much to Offer?

Google

# Facts and Features

	<b>Type</b> Single Family		<b>Year Built</b> 1928		<b>Heating</b> Radiant
	<b>Cooling</b> Central		<b>Parking</b> 2 spaces		<b>Lot</b> 7,400 sqft

## INTERIOR FEATURES

### Bedrooms

Beds: 3

### Bathrooms

Baths: 1 full, 1 half

### Heating and Cooling

Heating: Radiant

Heating: Gas

Cooling: Central

Basement

### Appliances

Appliances included:

Dishwasher, Dryer, Garbage disposal,  
Microwave, Range / Oven, Refrigerator,  
Trash compactor, Washer

### Flooring

Floor size: 2,346 sqft

Flooring: Hardwood

### Other Interior Features

[See More Facts and Features](#) ✓

## Home Value

Zestimate   
**\$565,863**

1010 Woodbine Ave, Oak Park,

# Comparables

- Statistics: learning from data
- **Descriptive** statistics summarize with no interpretation
- **Exploratory** data analysis (EDA): only makes claims about current sample

# Extending Comparables

- Relevant comparables may not be available
- Leverage limited data
- **Predictive** modeling or analytics: estimating value for a **new** unit
- Buyer's perspective

# Understanding Comparables

- Seller's perspective: does an investment to
  - remodel the kitchen or
  - paint or
  - landscape or
  - add a bathroom or
  - make life easier for my broker

make sense?

- **Inferential** statistics

# Machine Learning (ML)

- **Machine learning**: an algorithm allowing computer to build and improve a model from **data**

# Machine Learning (ML)

- **Machine learning**: an algorithm allowing computer to build and improve a model from **data**
- GLMs
- Logistic regression
- Decision trees
- Exam **MAS** material

# Machine Learning (ML)

- **Machine learning**: an algorithm allowing computer to build and improve a model from **data**
- GLMs
- Logistic regression
- Decision trees
- Exam **MAS** material
- **Not** ML: expert system, knowledge base

# Machine Learning (ML)

- **Machine learning:** an algorithm allowing computer to build and improve a model from **data**
- GLMs
- Logistic regression
- Decision trees
- Exam **MAS** material
- **Not** ML: expert system, knowledge base

## ML Problems

- Classification
- Regression
- Transcription
- Machine translation
- Anomaly detection
- Synthesis
- Impute missing values
- De-noise
- Density estimation

# Comparables. . .

- Encapsulate considerable domain expertise

...and are a powerful data representation

# Humans excel at image recognition...

- Humans can process images very quickly
  - The three images contain several **megabytes** of data,  $p \gg n$
- Computers can process structured text very quickly
  - The raw text contains a few **kilobytes** of information
- Which system would you rather try to program?

...and many other problems computers find hard

# Artificial Intelligence (AI)

- **Artificial Intelligence**: solving problems people find easy but computers find hard
  - Image recognition
  - Conversation, spoken words
  - Driving
  - Reading emotions
- Skills shared with other animals having neuron-based brains
- AI is a **problem domain**

# The Premise of AI...

## People have gotten a long way with a single algorithm

- Recent studies suggests the mammalian brain uses a **single algorithm** to solve most tasks
- Previously machine learning research was fragmented with distinct approaches for natural language processing, vision, motion planning and speech recognition

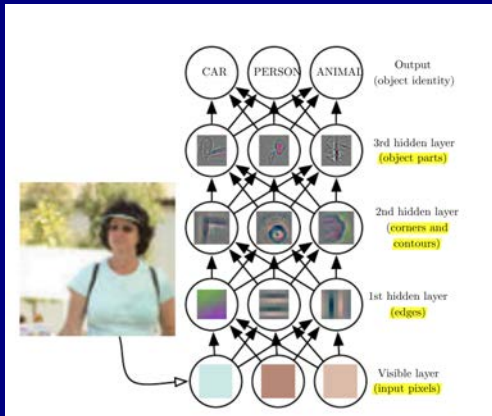

...today AI leverages a single general purpose algorithm  
inspired by, but not simulating, brain function  
to solve a wide range of problems

# AI General Purpose Algorithm

- Learn **model** from experience
  - Use machine learning
  - *Show don't tell* background information
- Understand the world as a **hierarchy of concepts**
  - Complicated concepts built out of simpler ones
- Learn what is **important**
  - Data **representation** created simultaneously with model
- Hierarchy of concepts has many layers
  - **Deep** learning

# AI General Purpose Algorithm...

- Hierarchy layers built using simple *neuron* nodes
- **Neural networks** build new covariates from non-linear **hinge** functions of existing covariates and the output of other layers
- Optimize overall fit with least squares

...algorithm inspired by our understanding of brain function

# AI General Purpose Algorithm: A Naïve Description

- Neural networks and deep learning are fancy least squares
  - Solve using **gradient descent** = walking downhill
  - Stochastic gradient descent = probably walking downhill
- Approximate complex functions by **compositions of simple ones**
- Build specialized problem solving nodes
  - recognize color...
  - recognize car vs truck vs bike vs motorcycle vs ...
  - can combine to recognize red car, blue truck, ...
- Pool, share and feedback information between nodes
- Nodes simultaneously learn model and data representation

# AI has a Long History...

Old Approach	New Approach
<b>Knowledge base:</b> hard-coded knowledge about world	<b>Machine Learning:</b> extract model from training data
<b>Expert system:</b> humans decide important features	<b>Representation Learning:</b> determine important factors of variation
<b>Neural networks</b>	<b>Deep learning</b> neural networks

...but hasn't always performed as expected

# Why Is AI Working Now?

- Better algorithms
- More data
- Bigger models

# Why AI Is Working Now: **Better Algorithms**

Pre-2006 deep networks were believed to be very **difficult to train**

- Better algorithms devised by Hinton in 2006 allowed deeper models by making them faster to train
- Beginning of the deep learning era
- Tens of thousands of researchers working in AI/ML

## A fast learning algorithm for deep belief nets

GE Hinton, S Osindero, YW Teh - Neural computation, **2006** - MIT Press

We show how to use “complementary priors” to eliminate the explaining-away effects that make inference difficult in densely connected belief nets that have many hidden layers.

Using complementary priors, we derive a fast, greedy algorithm that can learn deep, directed ...

Cited by 10337

# Why AI Is Working Now: **More Data**

- More data: IOT, Big Data, digitization of society
- **More data = less skill** required to train model
- Goodfellow data rules of thumb: a supervised deep learning algorithm will generally
  - achieve **acceptable** performance with around **5,000** labeled examples per category
  - will match or **exceed human** performance when trained with a dataset containing at least **10 million** labeled examples

# Why AI Is Working Now: **Bigger Models**

- Bigger = **deeper** models enabled by greater computational power and better algorithms
- Model size/depth: **connections** and **number** of neurons or nodes
- Biological neurons not densely connected
  - Models within order of magnitude of mammal brains connections
- Number of neurons: current models are very small
  - Doubling every 2.4 years
  - Match human brain by **2050**

...can't expect much from a leech-brain sized network

# Deep Learning Summary

**Deep learning** is an approach to AI. Specifically, it is a type of machine learning, a technique that allows computer systems to improve with experience and data.

- ... machine learning is the **only viable approach** to building AI systems that can operate in complicated, real-world environments
- Deep learning... achieves great power and flexibility by learning to represent the world as a **nested hierarchy of concepts**

Central Park Dreamscape CGI

# When Does AI Work Well?

## Stunning results

- Static, rules based environment
- Clean, direct observations
- Essentially limitless data
- Definitive right answer

## Examples

- Classification problems
- Image, speech recognition
- Pedestrian detection
- Traffic sign classification
- Simple dynamic control
- Reinforcement learning, robotics
- Synthetic data, alphaZero
- GANs

# When Does AI Work Well?

## Stunning results

- Static, rules based environment
- Clean, direct observations
- Essentially limitless data
- Definitive right answer

## Examples

- Classification problems
- Image, speech recognition
- Pedestrian detection
- Traffic sign classification
- Simple dynamic control
- Reinforcement learning, robotics
- Synthetic data, alphaZero
- GANs

## Characteristics of insurance

- Behavioral feedbacks
- Dynamic: reacts as we learn
- Proxy data, not direct
- **Inherently small** classes
- Uncertain information: claim development, trend
- Latency

# Real World Data

- **No Free Lunch** Theorem for ML

*Averaged over all possible data generating distributions, **every** classification algorithm has the **same error rate** on new data*

- No machine learning algorithm is universally any better than any other
- The most sophisticated algorithm has the same average performance as predicting every point belongs to the same class
- ML ignores grim prognosis and finds rules that are probably correct most of the time

...ML tools work well on real data

# AI Assumptions About *Real Data*

- Real data often appears very high dimensional ( $p \gg n$ ) but really contains **hidden structure**
- Photographs do not look like random images
  - Continuous: image near a photograph recognizable
  - No jumps or cliffs

Real images occupy a negligible proportion of the total volume of image space

# AI Assumptions About *Real Data*

Helpful **general purpose priors** or data rules of thumb

## Representation learning: A review and new perspectives

[Y Bengio](#), [A Courville](#), [P Vincent](#) - IEEE transactions on pattern ... 2013 - [ieeexplore.ieee.org](#)

The success of machine learning algorithms generally depends on data representation, and we hypothesize that this is because different representations can entangle and hide more or less the different explanatory factors of variation behind the data. Although specific domain knowledge can be used to help design representations, learning with generic priors can also be used, and the quest for AI is motivating the design of more powerful representation-learning algorithms implementing such priors. This paper reviews recent work in the area of ...

☆ ⓘ Cited by 4662 Related articles All 40 versions

# AI Assumptions About *Real Data*

Assumption	Concerns
<b>Smoothness</b>	Weather, butterfly effect; singularities
Multiple explanatory factors	Sudden change in relationship or sentiment
<b>Common material drivers</b>	
Shared factors across tasks	Phase change or market crash
<b>Hierarchical organization</b> of factors	
Simple <b>linear</b> factor dependencies	Log-linear: earthquakes
<b>Manifolds</b> : real data is low $d$	
Natural clustering	
<b>Sparsity</b> , 80/20 explanatory rule	
Temporal and spatial <b>coherence</b>	
Causal factors	State dependent causality

# AI Applications: Everything

# AI Applications: Everything

- Compare...
  - ...Blockchain Applications: Nothing

# AI Applications: Well... Almost Everything

# AI Applications: Well...Almost Everything

- Compare...
  - ...Blockchain Applications: Well...Identity

# Insurance-Related AI Applications

## Good fit, already live

- Marketing
- Customer service
- Underwriting homogeneous classes = predictive modeling
- Claims processing
- Fraud detection
- Health care

## Potential good fit

- Claims reserving
- Loss reserving, see Brian...
- Data quality
- Anomaly detection
- Data completion
- Underwriting **accounts** = detecting risk-aware management
- Risk management in high frequency lines

# More Challenging for AI

## **Data rules fail**

- Discontinuities
- State change
- Sentiment change
- Singularities: tornados, black holes
- Butterfly effect
- Weather models
- Cat models
- Identify next mass tort

# More Challenging for AI

## Data rules fail

- Discontinuities
- State change
- Sentiment change
- Singularities: tornados, black holes
- Butterfly effect
- Weather models
- Cat models
- Identify next mass tort

## The Limits of Predictability

- Observations = **Trials**  $\times$  **Probability**
- For Observations  $\geq 5000$ ...  
... need Trials  $\geq 5000/\text{Probability}$
- For  $p = 0.001$  need Trials  $\geq$  **5 million**
- For  $p = 10^{-6}$  need Trials  $\geq$  **5 billion**
  
- For  $p = 0.01$  see plenty of examples on  
r/CatastrophicFailure, r/IdiotsInCars,  
r/nononono, r/OSHA, r/Roadcam

# AI Compared to Catastrophe and Weather Models

- Given Observations = Trials  $\times$  Probability. . . is enough data **practically possible**?
- Weather and catastrophe models are physics-based models
- AI can work effectively in **conjunction** with physics-based models
- Avoid re-learning physics
- Physical models better than a learned phenomenological models

AI is being applied to high impact weather forecasting

# AI Bias and Sources of Modeling Failure

- Computers do not see images with semantic understanding
- Computers see things the eye cannot detect: lighting, type of camera
- Computers don't filter *irrelevant* information, background
- Basic statistics emphasizes training data must be a **random cross section** of population
  - Extend to include new characteristic picked up by ML
- Solutions
  1. Enhanced methodological rigor in the collection and management of training data
  2. Technical tools to analyze and diagnose the behavior of the model
  3. Training, education and caution in the deployment of ML in products

# AI Bias and Sources of Modeling Failure

- How does the model fail?
  - Technical problem inherent with algorithm?
  - Problem with implementation?
  - Institutional failure by large bureaucracy?
- Understanding decisions in big organization very complex
  - Like evaluating ML models *people are black boxes too*

...AI is just a machine—think washing machine  
not HAL9000—powerful but limited

Benedict Evans

# Cheat Sheet

Term	Definition
Statistics	Learning from Data
Descriptive Statistics	Facts, no interpretation
EDA	Current sample only, not generalization
Predictive modeling	Estimate value for a new unit, (MAS I and II)
Inferential statistics	Understand importance of explanatory data over population
Knowledge base	Human curated explanation of complex real-world system
Expert System	Rules based explanation of complex real-world system
Artificial Intelligence	Problem domain; solving problems people find easy but computers find hard
Machine Learning	Algorithm allowing computer to build and improve a model from data
Neural network	Multi-layered, inter-connected hinge function regression model, loosely modeled on brain function
Deep learning	Approach to AI; type of ML; learn complicated concepts by building out of many simpler ones
Representation Learning	Use ML to process figure data representation
